

4Trip is a comprehensive planning software solution for trains, buses and ferries. 4Trip enables staff to manage the development and release of service timetables, including the planning of work on track activities. 4Trip equips planning staff to create and manage plans weeks in advance of the day of operation, with the ability to amend the plan and re-release as needed. 4Trip advanced planning functionality allows better management of trains and track work, buses, and ferries.

4Trip enables planning staff to use a baseline Standard Working Timetable as the basis for creating and releasing the Daily Working Timetable. 4Trip allows several levels of precedence to be applied including daily working timetables, and special event working timetables, enabling customisation of the timetable for public holidays or specific maintenance requirements. 4Trip can schedule as far as business requirements require, with review and alteration capacity.

4Trip is designed for integration with live operations, which is then captured in the reporting and billing systems. This alignment of the timetabled plan with actual running data provides a picture of how operations are performing against the plan on the day of operations.

As a stand-alone system, 4Trip has been designed to integrate harmoniously into the control room environment complimenting existing operational systems based on individual site and network requirements. 4Trip can be customised to meet the specific customer network rules and business operating procedures.

4Trip is part of 4Tel's continued efforts to create a digitised transport network, using the best of internet-of-things technology to improve safety, increase situational awareness, and empower operations staff with dynamic tools for better operations management.
